3 RESEARCH INTERESTS

Research topics in my group are related to the design, development, and modeling of new functional materials for various advanced engineering applications. My research interests include polymer nanocomposites, biocomposites, biopolymers, biomass valorization, electrochemical properties of conducting polymers, and ionic liquids at electrode-electrolyte interfaces. We investigate the mechanical and thermal properties of polymer composites, the rates of ion transport through materials (using experiments and molecular simulations), study electrokinetic behaviors of colloids and surfaces in chemical mechanical planarization and water-treatment applications and design new polymeric materials for energy conversion and storage devices.
